

ABSTRACT OF DISCLOSURE

A security system providing increased security to storage type units and/or other valuable apparatuses. The security system works together with a manufacturer installed locking mechanism of the storage type unit or other valuable apparatuses. The security system prevents unauthorized users from accessing or using the storage type unit or other valuable apparatuses, even if the manufacturer installed locking mechanism has been penetrated by an unauthorized user having sufficient knowledge to operate the manufacturer installed locking mechanism without using a manufacturer provided key. The security system also provides varying levels of security to different components of a storage type unit or other valuable apparatuses so that users with different levels of authority are prevented from accessing and/or using certain compartments of the storage type unit or other valuable apparatuses that require a higher level of authority than provided to the user.
